af **AccessFinish**

The AI says “fixed.” We check the user can finish.

A repair agent: NVIDIA Nemotron 3 Super on Nebius Token Factory proposes code fixes; AccessFinish drives the real journey by keyboard, reads what was saved, reopens it in a fresh browser, and rejects every fix until it is proven. Track: Coding and Agentic Engineering.

Demo video (2 min)	youtu.be/XztxzjYYlO0
Live replay page	sultalfaifi.com/accessfinish
Every run + raw traces	sultalfaifi.com/accessfinish/evidence.html
Source (MIT)	github.com/SultanAlfaifi/accessfinish

0 / 77
false “booked” pages accepted: date saved wrong (67) or reopened wrong (10)

2 / 10
runs of agents v4–v5 where Nemotron fixed a real upstream keyboard bug, no root cause supplied (2 of 27 overall)

27 / 27
seeded control: wrong phone behind a success page, verified in every run

$6.38
estimated, at list price, for all 54 live runs on Nebius Token Factory

Review it in three minutes

1. **Open the page.** It opens on the keyboard case and replays a recorded live run; press **Pause** or **Show all** to take over. Offline: `npm run replay` → http://127.0.0.1:4178.
2. **Keyboard case: a real upstream bug in Easy!Appointments, fixed by Nemotron with no root cause supplied.** Click attempt 2’s red verify step: the page said *booked*, the database held 1 Nov instead of 2 Nov, and the timeline names the code that changed the typed date (`onMonthChange → getUnavailableDates → applyUnavailableDates → setDate`). Attempt 4 saves the right date but reopening shows today — a second bug. Attempt 6 is verified; download its patch from the proof card.
3. **Phone case (second tab): our seeded control.** The confirmation page said success but the database held the wrong phone: Nemotron’s diagnosis and one-line diff, then the proof card with the saved row, the fresh-browser reopen and nine checks.
4. **Every run, including failures.** The Evidence page lists all 54 live runs with replay links and raw traces, the results per agent version (v1–v5), and Nemotron’s usage on Token Factory.
5. **Run it yourself** (Node 22+, Docker): `npm run demo:setup` , set `NEBIUS_API_KEY` , then `node scripts/agent.cjs --case keyboard-date` .

Where NVIDIA and Nebius are used

Every diagnosis, code search and edit comes from `nvidia/nemotron-3-super-120b-a12b` through Nebius Token Factory’s OpenAI-compatible API, with three tools: `search_code` , `read_file` (read-only) and `propose_repair` (`lib/agent.cjs`). The verifier is deterministic and never calls a model: it builds each candidate in an offline Docker sandbox and checks the keyboard booking, a read-only database read-back, a fresh-browser reopen and regressions (mouse booking with different data, cleared date, reserved slot, untouched records, sandbox isolation).

Synthetic data in a pinned copy of open-source Easy!Appointments (GPL-3.0). Two journeys today; the phone fault was seeded on purpose. The 54 published runs were made live on GitHub Actions, 24–26 October 2026; the demo video is a screen recording of a further live run on 29 October.
